

Prompt Library for Content Generation

Mini Project – Generative AI

Name: Kritika Gahlawat

Introduction

This is my prompt library for common content generation tasks. I have used different prompt engineering techniques such as role prompting, few-shot prompting, RTCF and constraints. I have also used placeholders so that the prompts can be reused.

1. LinkedIn Post for a Student Project

Use Case: To write a LinkedIn post about a college project.

Techniques: Role Prompting + Few-Shot + Constraints

Template:

You are a LinkedIn content writer. Write a LinkedIn post about my project Library Management System, made using Java and MySQL. The audience is college students and recruiters. Mention what I learned: database connectivity, CRUD operations and problem-solving. Keep it around 100–120 words. Use a simple and positive student tone. Start with a short opening and end with a question.

Sample Output:

Edit

Project Highlight: Library Management System 📁 💻

Excited to share one of my projects — a **Library Management System** developed using **Java** and **MySQL**!

Working on this project gave me practical experience in connecting a Java application with a MySQL database and managing data efficiently. I learned how to implement **CRUD operations** (Create, Read, Update, and Delete) and improved my **problem-solving skills** by handling different challenges during development.

This project helped me understand how programming concepts can be applied to build a useful real-world application. It was a great learning experience and strengthened my confidence in Java and database development.

What project helped you learn the most during college? 🚀

Iteration: V1 → V2: In V1 I only asked for a LinkedIn post. In V2 I added the audience, tone, word limit and an example. This made the result more focused.

2. Blog Introduction

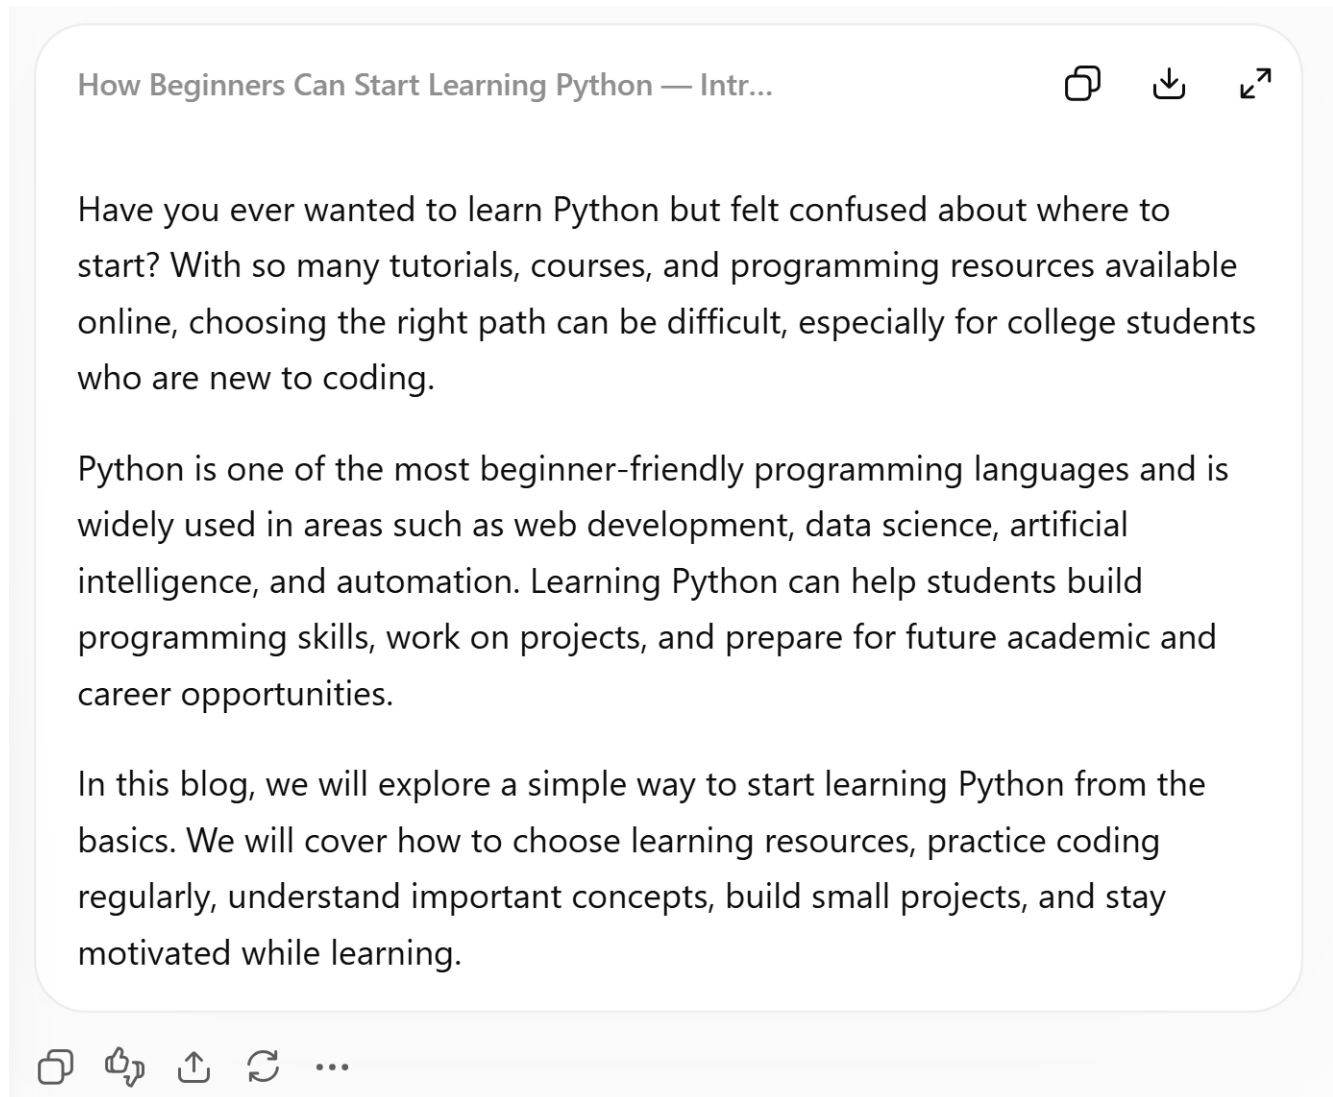

Use Case: To write the first paragraph of a student blog.

Techniques: Role Prompting + RTCF + Constraints

Template:

You are a blog writer. Write an introduction for a blog about How Beginners Can Start Learning Python. The readers are college students. The purpose of the blog is to help beginners understand how to start learning Python. Start with a question or common problem. Explain why the topic is useful and briefly say what the blog will cover. Write 120–150 words in simple language.

Sample Output:

Iteration: V1 → V2: I added the target readers, purpose, structure and word limit. The second version gave a more useful introduction.

3. Cold Outreach Email

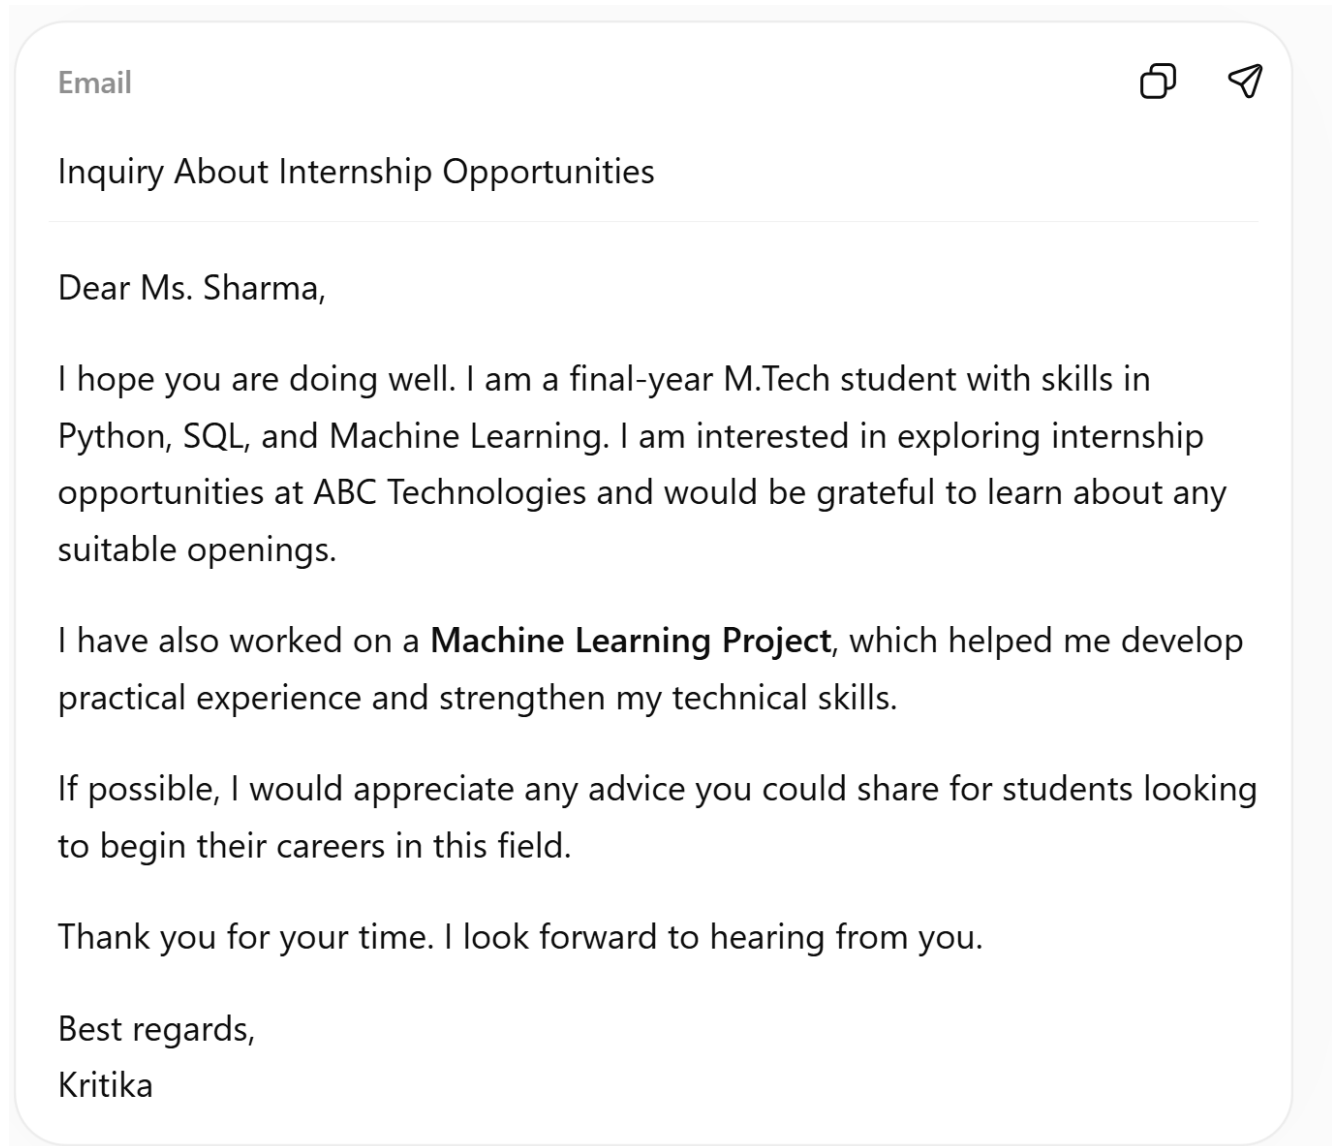

Use Case: To contact a company or professional for an opportunity or advice.

Techniques: Role Prompting + Constraints + RTCF

Template:

You are a career mentor. Write a short email to Ms. Sharma, who is an HR Manager at ABC Technologies. I am a final-year M.Tech student and my skills are Python, SQL and Machine Learning. I am contacting her because I am interested in internship opportunities. Mention my project Machine Learning Project. I want to ask about internship opportunities and advice for students. Keep it under 120 words. Be polite and confident, not desperate.

Sample Output:

Iteration: V1 → V2: The first prompt was just “write a cold email for a job”. I added my background, reason, project, request and word limit, so the email sounded more natural.
